// problem and solution

Get PC Specs

Know if it runs, before you download.

/* The question */

428 × 104

Before you download, will it run on my PC?

GPS

01

Check your PC

Windows settings, Task Manager and Device Manager.

02

Find the requirements

Store pages, vendor sites and forums.

03

Compare by hand

Two lists, row by row, hoping you did not mix up minimum and recommended.

// same chore before you download, buy, update or install

/* Problem 01 */

Your specs are buried in Windows

276 × 104

GPS

- Windows settings
- Task Manager
- Device Manager

// you need to find

- CPU
- GPU
- RAM
- Free disk space
- OS version
- and more

/* Problem 02 */

Requirements are scattered and full of jargon

275 × 104

GPS

Store pages

Vendor sites

Forums

// decode the jargon

VRAM ?

SSE4.2 ?

min / rec ?

/* Problem 03 */

You compare two lists by hand

336 × 104

GPS

// software needs · example data

component	min	rec
CPU	4 cores	6 cores
RAM	16 GB	32 GB
GPU memory	6 GB	8 GB
Free disk	80 GB	80 GB
OS	Windows 10	Windows 11

user

// your PC

value
8 cores
8 GB min or rec?
4 GB
240 GB
Windows 11

/* Problem 04 */

A wrong guess costs hours of download

248 × 104

GPS

```
> downloading 80 GB

                                                    99%

ERR_REQUIREMENTS_NOT_MET

// 80 GB downloaded, hours spent, nothing to run
```

/* Problem 05 */

Asking a chatbot creates new risks

395 × 104

GPS

// privacy

Specs leave your PC

Sending your hardware data to a hosted LLM is not safe.

// guesswork

Numbers get invented

A model can guess a requirement, and you cannot see how.

// untrusted data

Prompt injection

Requirement text from the web can carry instructions meant for the model.

// the fix has to be private, explainable and screened

/* The solution */

GPS puts all of that in one place.

577 × 142

GPS

// step 01

Scan

Reads your real hardware, locally.

→

// step 02

Compare

Lines up requirements and specs, row by row.

→

// step 03

Decide

Gives one verdict: yes or no.

// many sources, many tabs: now one dashboard

/* Solution 01 · Scan */

The scan reads your real hardware

560 × 104

GPS

```
$ gps scan --local
```

// the scan stays on your machine

CPU

Marketing name, with vendor noise removed.

GPU

A dedicated card wins over an integrated one.

RAM

Total memory, shown in GB.

Disk

Free space on the system drive.

OS

Windows 11 is detected by build number 22000 or higher.

// ctypes · winreg · wmic / PowerShell · psutil

/* Solution 02 · Compare */

Compare puts needs and specs side by side

483 × 104

GPS

Look up

// groq + live web search

Same labels

// the scan's labels, strict JSON

Screen it

// prompt guard screens it

component	software needs	your pc
CPU	4 cores	8 cores
RAM	16 GB	8 GB
GPU memory	6 GB	4 GB
Free disk	80 GB	240 GB
OS	Windows 10	Windows 11

Prompt Guard passed · 5 values
